

SEVAK AI

Agentic AI for volunteer recruitment, allocation, dispatch and welfare at the Simhastha Kumbh Mela

Tens of thousands of volunteers are deployed across the mela on paper registers and WhatsApp groups. **SEVAK AI turns that into a live, auditable, language-native operating system that runs on the phone every volunteer already owns.**

THE PROBLEM, IN OPERATIONAL TERMS

- **Allocation is static.** A volunteer is posted on day one and stays there while crowd load moves by the hour.
- **Skills are invisible.** A first aider, a Tamil speaker and an ambulance driver look identical in the register.
- **Dispatch is slow.** A lost child report climbs to

a control room and back down instead of reaching the nearest qualified volunteer.

- **Welfare is unmanaged.** Fatigue, heat exposure, meal gaps and no shows surface only when a post collapses.
- **Nothing compounds.** A mela administration dissolves after the cycle, so every Simhastha starts from zero.

HOW IT WORKS

Volunteer QR or WhatsApp message → voice interview in Marathi, Hindi or English → ID and verification → digital pass → geofenced check in at the post → briefing and tasks on the same chat → hours record and certificate. No app to install.

Officer One zone screen showing present headcount against required headcount by post, live gaps, and escalations only when the agent is uncertain. Approves or edits every roster. Overrides anything, instantly.

THE AGENT STACK

Agent	Job	Autonomy
Intake	Conversational registration, ID capture, consent	L2
Profiling	Extract skill, language, certification, availability	L2
Verification	Assemble the police verification packet, block unverified deployment	L1
Roster	Build and repair shifts against headcount, skill mix, fatigue and safety rules	L1
Briefing	Post level daily briefing and micro training in the volunteer's language	L2
Dispatch	Match a non emergency request to the nearest qualified on shift volunteer	L1
Field Assist	Answer from the SOP library, translate for pilgrims, guide report filing	L2
Welfare	Track hours, rest, meals, heat exposure and no contact intervals	L2
Supervisor Copilot	Shift summary, gap forecast, drafted escalation note	L0
Records	Hour records, certificates, after action data pack	L2

L0 suggests only. L1 acts after human confirmation. L2 acts and notifies. Nothing touching life safety runs above L1.

WHY THIS BEATS WHAT EXISTS TODAY

- **Versus WhatsApp groups.** Groups broadcast. They do not assign, confirm, escalate or record. This is closed loop task state, not messaging.
- **Versus volunteer management SaaS.** Those assume app installs, English, stable networks and low stakes. None hold at a ghat during a snan.
- **Versus a government portal.** A portal captures registrations. It does not repair a roster at 4 am when 40 percent of a post fails to appear.

WHO IT SERVES

Stakeholder	What they get
Zonal officer	Live presence and gap visibility, fewer coordination calls, an audit trail
Student volunteer	Clear next task, language native support, verified hours and certificate
Sanstha and akhada blocks	Group level deployment with their own hierarchy respected
Simhastha cell and NMC	Auditable coverage by post and hour, after action report on day one
Police and health	Read only view of which trained civilian assets are present and where
CSR partners	Timestamped, verified record of employee volunteer hours

SAFETY AND HUMAN OVERRIDE

- All life safety dispatch stays on the existing police and health channel in Phase 1. The system observes. It does not route emergencies.
- Every answer is grounded in an approved SOP and cites its source. The agent refuses when no source matches.
- Human override is absolute, instant and logged. No agent action reverses a human decision.
- Offline first. SMS and IVR fallback. A printed roster at every post the previous evening. The system is never the only copy.
- India hosted, DPDP aligned, data minimised, role based access, fixed retention.

PILOT

Scope Intake, Profiling, Roster, Briefing, Field Assist, Records. Dispatch deferred.

Scale 150 to 300 volunteers, 3 to 5 posts, one accountable coordinator per post, three days minimum.

Where A real Nashik crowd event before the mela, with genuine coordination pressure and a real accountable officer.

Proves Check in rate against roster, task completion confirmation, and whether a coordinator uses it for a second shift without being asked.

ROADMAP

30 days	15 officer and 20 volunteer conversations, data model confirmed against real records
45 to 60 days	Written approach to three departments, intake and profiling live with 200 real volunteers
90 days	Field pilot plus a degraded mode drill with no data loss
120 days	One signed letter of intent or MOU
6 to 9 months	Officer led second pilot, security audit, scope freeze, deployment build
2027 cycle	Live operation across assigned zones

WHAT WE STILL HAVE TO PROVE

- That the administration grants operational authority, not only a registration role. This single belief decides the project.
- That Marathi voice intake works for rural and low literacy volunteers across dialects.
- That a coordinator trusts an agent proposed roster under pressure.
- That the system transfers to a second mass gathering with configuration, not a rebuild.

THE ASK

1. A named counterpart in the Simhastha cell, NMC or Police to co design the pilot.
2. One live event and one accountable coordinator to run a 300 volunteer pilot.
3. Discovery and build support, plus an Indic language and cloud partner.
4. Access to Simhastha 2015 volunteer records and the 2027 zone structure.
